

As metaphor, I chose to represent the vascular anatomy of the leaf for its potency as a renewable energy system of incredible efficiency. Clearly the ability to photosynthesize water, sunlight and CO₂ into stored carbon energy while expiring oxygen to balance the biosphere is a process that enables our survival. The leaf is a biological converter of immense capacity. It feeds us, it keeps us warm and puts gas in our tank!

These sails catch the breeze and rotate the turbine. I have been testing a model of *Air Leaf Mobile* for the past 4 years. In strong winds the sails self govern by rotating 360 degrees...they perform a delightful dance in the breeze.
